

### Projects soil decontamination and remediation

The company undertakes studies, works and supplies for final restoration i.e. the construction of infrastructure and anatomies necessary for environmental restoration, and addressing environmental impacts on areas affected. Below are some of the steps for repairing and disinfecting areas.

- Design of restoration projects
- Earthworks and other development and stability of slopes including business travel and waste Resurfacing
- Construction of final cover after the required barrier
- Construction project management leachate
- Construction of stormwater management projects
- Construction of road projects
- Construction projects green
- Supply of equipment for mobile service projects and control of space
- Design and execution of research monitoring groundwater pollution, drainage, subsidence throughout the construction period of project
- Test operation sections of the project and putting into effective operation of the project.
